Question 1

A.)

ans.

Weak entity sets :

When the attributes associated with an entity set are not sufficient to uniquely identify an entity, then this is called a weak entity.

A weak entity set doesn't have any primary key for discriminating the entities in a set, the weak entity set is dependant on a particular strong entity set.

The weak entity set gets its primary key by combining the discriminating attributes of weak entity and the primary key of 'identifying' strong entity set.

Representation in ER Diagram.

- ① The weak entity set is shown by a double rectangle.
- ② Attributes of weak entity set are underlined with a dashed line.
- ③ Relationship of a weak entity set with a strong entity set is shown with a double diamond.

Ques 1

B.)

Armstrong axioms have to be sound and complete

Axioms

Reflexivity \Rightarrow if $\beta \subseteq \alpha$ then $\alpha \rightarrow \beta$

Augmentation \Rightarrow if $\alpha \rightarrow \beta$ holds and γ is another attribute set then $\alpha\gamma \rightarrow \gamma\beta$ also holds

Transitivity \Rightarrow if $\alpha \rightarrow \beta$ holds and $\beta \rightarrow \gamma$ also holds then the implication that $\alpha \rightarrow \gamma$ also holds true

Sound: Given a set of functional dependencies F on a Relational schema R , any dependency that we can infer from F using the primary rules of Armstrong axioms holds in every relation state of R that satisfies the dependencies in F

Complete: using Primary rules repeatedly to infer dependencies until no more dependencies can be inferred.

\hookrightarrow Hence complete set of dependencies possible are included.

Ques 2

1.
ans

Entities :

- 1) Departments
- 2) Projects
- 3) Employees

Enterprise :

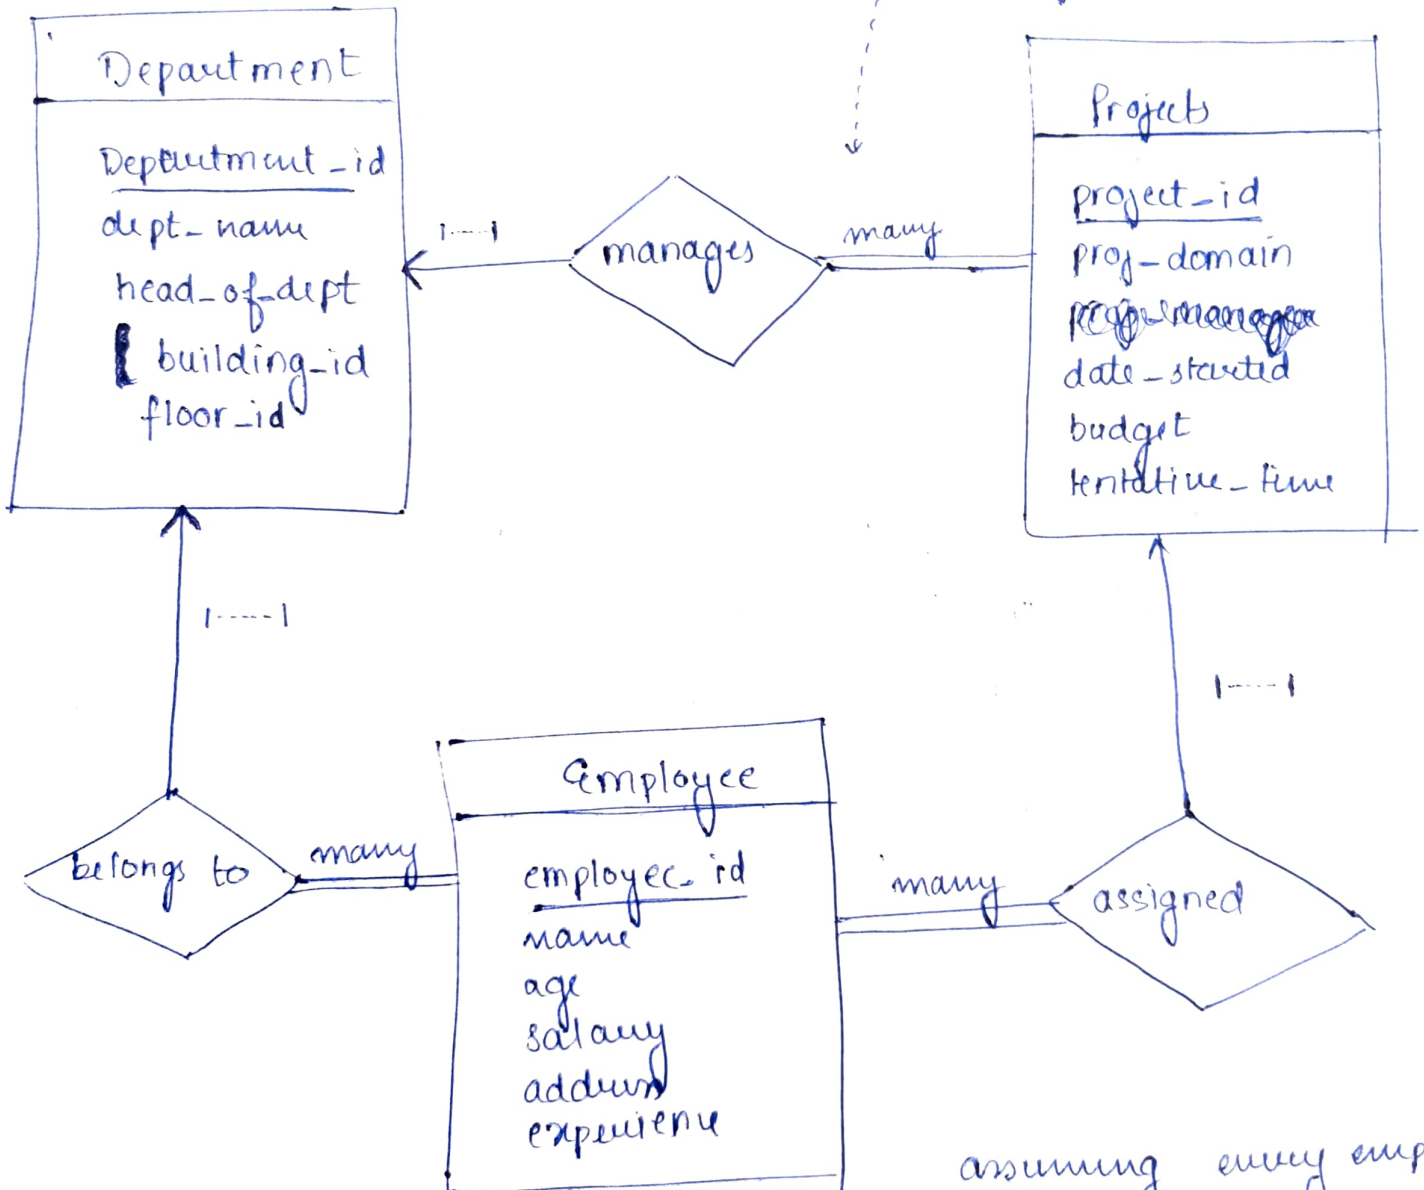

AR Construction
House

2)

Entity 1	Entity 2	relationship	Participa ⁿ Type
Employee (Full)	Department (Partial)	'belongs to'	mentioned in brackets
Department (Partial)	Projects (Full)	'manages'	
Employee (Full)	Project (Partial)	'assigned'	

3)

Full participation because any project would definitely belong to a dept.

assuming every employee is necessarily assigned to a project.

4)

Initially we create a tentative.

Department (Department-id, dept-name, head-of-dept,
building-id, floor-id)

Projects (Project-id, project-domain, date-started, budget, tentative-time)

Employee (employee-id, name, age, salary, address, experience)

Relationships { These are not schemas only explanations }

manages (participation is full on project side (many)
" " partial on Dept. side (one)

add primary key of Department to Attributes of Projects

belongs to (Employee has full participation (many side)
Department " partial participation (one side)

add primary key of Department to relational schema of Employee

assigned (Employee side - many - full participation
Project - one - partial participation

so add primary key of projects to Employee schema

-----x-----x-----x-----x-----x-----x-----x-----x-----
FINALLY → Final Relational Schemas

Department < ^{*pk}Department-id, dept-name, head-of-dept, building-id, floor-id >

Projects < ^{*pk}Project-id, ^{*fk}Department-id, proj-domain, date-started, budget, tentative-time >

Employee < ^{*pk}employee-id, ^{*fk}project-id, ^{*fk}department-id, name, age, salary, address, experience >
